

QA Automation Test Exercise

Requirements:

Write tests against a mock API that is the provider for User Admin functionality

The mock API has the following 4 operations, and just handles plain old java objects

- Create
 - Creates a user
 - Returns the newly created user
- Read
 - Returns list of active users
- Update
 - Updates an existing user
 - Returns the updated user
- Delete
 - Deletes an existing user
 - Returns a success indicator

The user object would have the following data structure:

username : String (required)

password : String (required)

email : String

firstName : String

username : String
